Tanh Linh town, Binh Thuan province is a new, pristine land. This place has many mountain and river scenes and very rich nature. But along with that wilderness comes a lack of facilities, clean water, energy and many other shortages of the people.

Tanh Linh town faces many difficulties, but the main highlight is the lack of clean water and facilities for the people. everything is still too primitive

Recently, in Tanh Linh province, 12,517 households/42,277 people suffered from water shortages. The number of households and people at risk of water shortage in the near future is 20,599 households/57,266 people.

However, from the beginning of 2024 until now, due to the impact of prolonged hot weather, temperatures have increased, so the underground water level has lowered. Along with that, the flow of natural rivers and streams is depleted, leading to a shortage of raw water to serve the operation of water supply projects using natural water sources. This is the main cause of local water shortages in rural areas recently.

In Duc Binh commune, Tanh Linh district, Nui Ong stream has dried up, causing the Duc Binh water plant to not have enough raw water source to provide domestic water for people in villages 4 and 3.

running out of water in Nui Ong stream

According to the Center for Clean Water and Rural Environmental Sanitation in Binh Thuan, water plants as management units are at risk of lacking raw water in the near future, causing rivers to dry up. For example, in Tanh Linh

area, water sources are running out. The center has been working hard at the water intake location to take advantage of the cold water source to supply water for the Duc Phu water plant to operate, but it is not enough to meet the demand. In addition, the raw water source of Song Dinh Forest Enterprise lake is exhausted, it is estimated that the amount of raw water remaining in the lake is only enough to handle water supply until the end of May 2024.

Transporting water by tanker truck to support people in Tanh Linh town
